

Teamcenter 13 – Office Integration

To run the office integration, look for the configuration shortcut on your desktop or start menu and launch it. Please exit Teamcenter before running this as it will close the session.

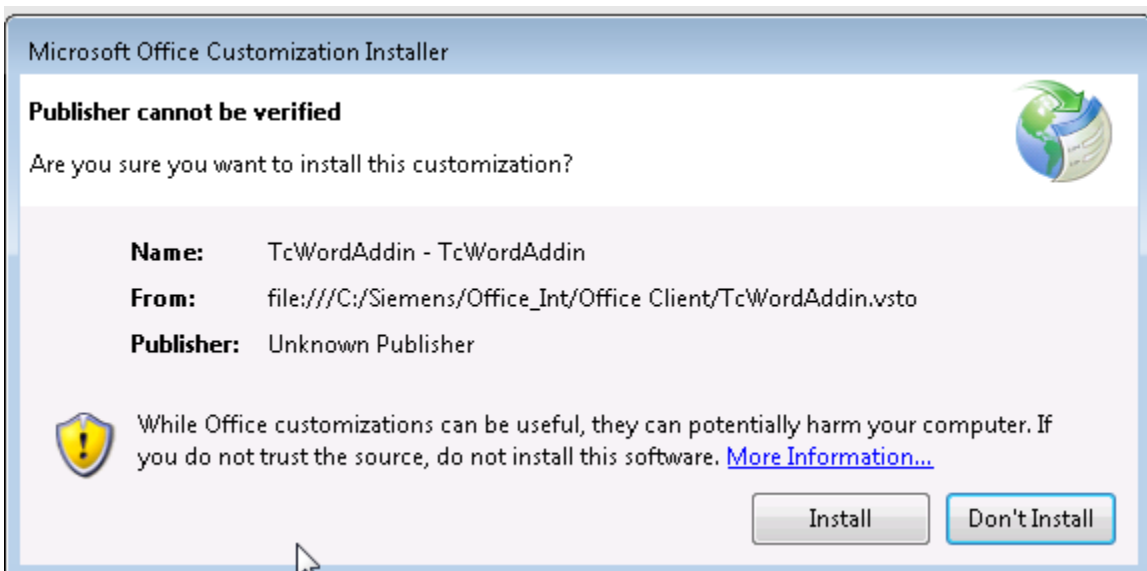

Enter the number of the environment you will be connecting to.

Office will be configured, and the window will close. You are ready to connect to Teamcenter through office.

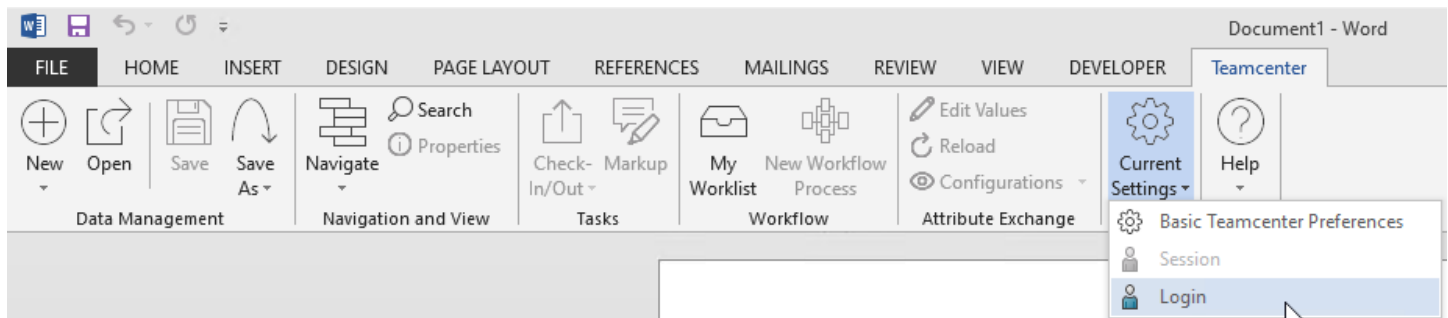

When launching an office product, you may be prompted to install the add-in. Please select install.

Once the office program opens you should see a Teamcenter ribbon. Select the ribbon, Current Settings → Login.

If an SSO session was configured, you will be logged in automatically.

If you are connecting to Development, you will see a list of environments and selecting one will present you with the login screen.

Note (1)

Connections 1. US Production and 2. Europe Production utilize SSO. When these environments are selected the SSO application for Teamcenter will launch to prepare for connection. This application is required to be running to connect to SSO environments. If the computer is shutdown or restarted the configuration utility will have to be reran.

Note (2)

Connection 3. Development will setup office to connect to all environments available in the Development client. Currently US Development, Europe Development and EQ Orange. You will not need to run this utility every time once configured. You will only need to run the utility if switching back from Development to Production.
